Packaging Personified is a leader in micro-perforated films. Our in-house perforation systems create precise venting patterns in flexible packaging that extend the shelf life of fruits, vegetables and other products. With consistent vent patterns, this practice alters films oxygen transmission for optimal breathability.

Pinpoint accuracy will hide these venting patterns from consumers' eyes and therefore not take away from your packages design and retail appeal. Unlike traditional venting practices, micro-perforation provides more protection against contaminants due to its smaller vents and laser sealed edges.
